Data Summarization

Recap

- select(): subset and/or reorder columns
- filter(): remove rows
- arrange(): reorder rows
- mutate(): create new columns or modify them
- select() and filter() can be combined together
- remove a column: select() with ! mark(!col_name)
- you can do sequential steps: especially using pipes %>%

Cheatsheet

Another Cheatsheet

https://raw.githubusercontent.com/rstudio/cheatsheets/main/datatransformation.pdf

Data transformation with dplyr : : **CHEAT SHEET**

dplyr functions work with pipes and expect tidy data. In tidy data: nines Each variable is in Each observation, or x %>% f(v) its own **column** case, is in its own row becomes f(x, y) Summarise Cases Apply summary functions to columns to create a new table of summary statistics. Summary functions take vectors as input and return one value (see back). summary function summarise(.data, ...) Compute table of summaries. summarise(mtcars, avg = mean(mpg) count(.data, ..., wt = NULL, sort = FALSE, name = NULL) Count number of rows in each group defined by the variables in ... Also tally(). count(mtcars, cvl) **Group Cases**

Use **group_by**(.data, ..., .add = FALSE, .drop = TRUE) to create a "grouped" copy of a table grouped by columns in ... dplyr functions will manipulate each "group" separately and combine the results.

Manipulate Cases

EXTRACT CASES Row functions return a subset of rows as a new table.

Manipulate Variables

EXTRACT VARIABLES

Column functions return a set of columns as a new vector or table. pull(.data, var = -1, name = NULL, ...) Extract column values as a vector, by name or index. pull(mtcars, wt) select(.data, ...) Extract columns as a table. select(mtcars, mpg, wt)

> relocate(.data, ..., .before = NULL, .after = NULL) Move columns to new position. relocate(mtcars, mpg, cyl, .after = last_col())

Use these helpers with select() and across()

e.g. select(mtcars, mpg:cyl contains(match) num_range(prefix, range) :, e.g. mpg:cyl ends_with(match) all_of(x)/any_of(x, ..., vars) -, e.g, -gear everything() everything() starts_with(match) matches(match)

MANIPULATE MULTIPLE VARIABLES AT ONCE

summarise(mtcars, across(everything(), mean)

c_across(.cols) Compute across columns in row-wise data. transmute(rowwise(UKgas), total = sum(c_across(1:2)))

MAKE NEW VARIABLES

Apply vectorized functions to columns. Vectorized functions take vectors as input and return vectors of the same length as output (see hack)

Data Summarization

- Basic statistical summarization
 - mean(x): takes the mean of x
 - sd(x): takes the standard deviation of x
 - median(x): takes the median of x
 - quantile(x): displays sample quantiles of x. Default is min, IQR, max
 - range(x): displays the range. Same as c(min(x), max(x))
 - sum(x):sum of x
 - max(x): maximum value in x
 - min(x): minimum value in x

Some examples

We can use the CO_heat_ER object from the dasehr package to explore different ways of summarizing data. (This dataset contains information about the number and rate of visits for heat-related illness to ERs in Colorado from 2011-2022, adjusted for age.) The head command displays the first rows of an object:

library(dasehr)
head(CO_heat_ER)

#	A tibble:	6 × 7					
	county	rate	lower95cl	upper95cl	visits	year	gender
	<chr></chr>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<chr></chr>
1	Statewide	5.64	4.70	6.59	140	2011	Female
2	Statewide	7.39	6.30	8.47	183	2011	Male
3	Statewide	6.51	5.80	7.23	323	2011	Both genders
4	Statewide	5.64	4.72	6.57	146	2012	Female
5	Statewide	7.56	6.48	8.65	193	2012	Male
6	Statewide	6.58	5.88	7.29	339	2012	Both genders

Behavior of pull() function

pull() converts a single data column into a vector. This allows you to run summary functions.

CO_heat_ER %>% pull(visits)

Statistical summarization the "tidy" way

Add the na.rm = argument for missing data

CO_heat_ER %>% pull(visits) %>% mean()

[1] NA

CO_heat_ER %>% pull(visits) %>% mean(na.rm=T)

[1] 9.791114

Summarization on tibbles (data frames)

summarize creates a summary table.

Multiple summary statistics can be calculated at once (unlike pull() which can only do a single calculation on one column).

```
# General format - Not the code!
{data to use} %>%
    summarize({summary column name} = {function(source column)},
        {summary column name} = {function(source column)})
```

summarize() can do multiple operations at once. Just separate by a comma.

```
CO_heat_ER %>%
summarize(mean_visits = mean(visits, na.rm = TRUE),
    median_visits = median(visits, na.rm = TRUE),
    mean_rate = mean(rate, na.rm = TRUE))
```

Note that summarize() creates a separate tibble from the original data.

If you want to save a summary statistic in the original data, use mutate() instead to create a new column for the summary statistic.

summary() Function

Using summary() can give you rough snapshots of each numeric column (character columns are skipped):

summary(CO_heat_ER)

county		rate		lower	lower95cl		upper95cl	
Length: 2340		Min.	: 0.000	Min.	: 0.000	Min.	: 0.000	
Class :c	haracter	1st Qu	I.: 0.000	1st Qu	.: 0.000	1st Qu.	: 0.000	
Mode :c	haracter	Mediar	1 : 0.000	Median	: 0.000	Median	: 0.000	
		Mean	: 1.869	Mean	: 1.119	Mean	: 2.755	
		3rd Qu	I.: 0.000	3rd Qu	.: 0.000	3rd Qu.	: 0.000	
		Max.	:89.275	Max.	:43.398	Max.	:151.420	
		NA's	:832	NA's	:832	NA's	:832	
visi	ts	УE	ear	gender				
Min. :	0.000	Min.	:2011	Length:234	40			
1st Qu.:	0.000	1st Qu.	:2014 (Class :cha	aracter			
Median :	0.000	Median	:2016	Mode :cha	aracter			
Mean :	9.791	Mean	:2016					
3rd Qu.:	0.000	3rd Qu.	:2019					
Max. :	494.000	Max.	:2022					
NA's :	832							

Summary & Lab Part 1

- summary stats (mean()) work with pull()
- don't forget the na.rm = TRUE argument!
- summary(x): quantile information
- summarize: creates a summary table of columns of interest
- Class Website
- 🛛 Lab

distinct() values

distinct(x) will return the unique elements of column x.

CO_heat_ER %>%
 distinct(gender)

- # A tibble: 3 × 1
 gender
 <chr>
- 1 Female
- 2 Male
- 3 Both genders

How many distinct() values?

n_distinct() tells you the number of unique elements. *Must pull the column first!*

CO_heat_ER %>%
 pull(gender) %>%
 n_distinct()

[1] 3

dplyr: count

Use count to return row count by category.

CO_heat_ER %>% count(gender)

dplyr: count

Multiple columns listed further subdivides the count.

CO_heat_ER %>% count(county, gender)

#	A tibble: :	195 × 3	
	county	gender	n
	<chr></chr>	<chr></chr>	<int></int>
1	Adams	Both genders	12
2	Adams	Female	12
3	Adams	Male	12
4	Alamosa	Both genders	12
5	Alamosa	Female	12
6	Alamosa	Male	12
7	Arapahoe	Both genders	12
8	Arapahoe	Female	12
9	Arapahoe	Male	12
10	Archuleta	Both genders	12
#	185 more	rows	

Grouping

Perform Operations By Groups: dplyr

group_by allows you group the data set by variables/columns you specify:

CO_heat_ER_grouped <- CO_heat_ER %>% group_by(gender)
CO_heat_ER_grouped

# A tibble: 2,340 × 7							
# (Groups:	gender	[3]				
	county	rate	lower95cl	upper95cl	visits	year	gender
	<chr></chr>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<dbl></dbl>	<chr></chr>
1	Statewide	5.64	4.70	6.59	140	2011	Female
2	Statewide	7.39	6.30	8.47	183	2011	Male
3	Statewide	6.51	5.80	7.23	323	2011	Both genders
4	Statewide	5.64	4.72	6.57	146	2012	Female
5	Statewide	7.56	6.48	8.65	193	2012	Male
6	Statewide	6.58	5.88	7.29	339	2012	Both genders
7	Statewide	4.94	4.06	5.82	124	2013	Female
8	Statewide	6.72	5.72	7.72	178	2013	Male
9	Statewide	5.82	5.16	6.49	302	2013	Both genders
10	Statewide	3.52	2.80	4.25	92	2014	Female

0 2,330 more rows

Summarize the grouped data

It's grouped! Grouping doesn't change the data in any way, but how **functions operate on it**. Now we can summarize visits by group:

Use the pipe to string these together!

Pipe CO_heat_ER into group_by, then pipe that into summarize:

Group by as many variables as you want

group_by gender and year:

```
CO heat ER %>%
 group_by(year, gender) %>%
 summarize(avg visits = mean(visits, na.rm = TRUE))
# A tibble: 36 × 3
# Groups: year [12]
   year gender
                    avg visits
  <dbl> <chr>
                        <dbl>
1 2011 Both genders
                         11.3
 2 2011 Female
                        4.32
                        6.06
 3 2011 Male
 4 2012 Both genders
                         12.8
 5
  2012 Female
                        4.76
   2012 Male
                        6.71
6
 7 2013 Both genders
                        12.4
8 2013 Female
                        3.72
9 2013 Male
                        6.11
10 2014 Both genders
                      9.67
# 26 more rows
```

23/35

Counting

There are other functions, such as **n()** count the number of observations (NAs included).

Counting

count() and n() can give very similar information.

CO_heat_ER %>% count(gender)

A tibble: 3 × 2
gender n
<chr> <int>
1 Both genders 780
2 Female 780
3 Male 780

CO_heat_ER %>% group_by(gender) %>% summarize(n()) # n() typically used with summarize

#	A tibble: 3	× 2
	gender	`n()`
	<chr></chr>	<int></int>
1	Both genders	780
2	Female	780
3	Male	780

A few miscellaneous topics ..

Base R functions you might see: length and unique

These functions require a column as a vector using pull().

CO_heat_ER_gen <- CO_heat_ER %>% pull(gender) # pull() to make a vector CO_heat_ER_gen %>% unique() # similar to distinct()

[1] "Female" "Male" "Both genders"

Base R functions you might see: length and unique

These functions require a column as a vector using pull().

CO_heat_ER_gen %>% unique() %>% length() # similar to n_distinct()

[1] 3

* New! * Many dplyr functions now have a .by= argument

Pipe CO_heat_ER into group_by, then pipe that into summarize:

is the same as..

summary() vs. summarize()

- summary() (base R) gives statistics table on a dataset.
- summarize() (dplyr) creates a more customized summary tibble/dataframe.

Summary & Lab Part 2

- count(x): what unique values do you have?
 - distinct(): what are the distinct values?
 - n_distinct() with pull(): how many distinct values?
- group_by(): changes all subsequent functions
 - combine with summarize() to get statistics per group
 - combine with mutate() to add column
- summarize() with n() gives the count (NAs included)
- Class Website
- I Lab

Extra Slides: More advanced summarization

Data Summarization on data frames

- Statistical summarization across the data frame
 - rowMeans(x): takes the means of each row of x
 - colMeans(x): takes the means of each column of x
 - rowSums(x): takes the sum of each row of x
 - colSums(x): takes the sum of each column of x

yearly_co2 <- yearly_co2_emissions</pre>

rowMeans() example

Get means for each row.

3 Algeria

4 Andorra

5 Angola

129800

32040

487

Let's see what the mean CO2 emissions is across years for each row (country):

```
yearly_co2 %>%
  select(starts_with("201")) %>%
  rowMeans(na.rm = TRUE) %>%
  head(n = 5)
[1]
    10254
             5106 129800
                          487 32040
yearly_co2 %>%
  group by(country) %>%
  summarize(mean = rowMeans(across(starts_with("201")), na.rm = TRUE)) %>%
  head(n = 5)
# A tibble: 5 \times 2
  country
                mean
           <dbl>
  <chr>
1 Afghanistan 10254
2 Albania
                5106
```

colMeans() example

Get means for each column.

Let's see what the mean is across each column (year):

```
yearly_co2 %>%
               select(starts_with("201")) %>%
              colMeans(na.rm = TRUE) %>%
              head(n = 5)
                             2010
                                                                                                                                                               2012
                                                                                              2011
                                                                                                                                                                                                                                 2013
                                                                                                                                                                                                                                                                                                   2014
165334.1 171764.9 174033.4 174856.2 175992.5
yearly_co2 %>%
               summarize(across(starts_with("201"), ~mean(.x, na.rm = TRUE)))
